

Completed 2 steps

Found it! Here's the full picture, Anthony.

The Source Page

The data reference you're looking for lives in the Notion page titled

local-innovation-digital-opportunities

, which is nested under a parent page called "content" . It was last saved on **November 18, 2025**, and published/dated **October 1, 2025**, under the Digital Allies byline .

The Specific Data Point

Here's the exact passage containing the traffic insight you're referencing :

*"I recently worked with a client whose customer base spans all three cities, and their analytics told a fascinating story: **mobile traffic peaks on weekends (tourists)**, **desktop traffic dominates weekdays (local residents)**, and Spanish-language content drives significantly more engagement than they expected."*

The supporting context around it cites Google Think data: **74% of leisure travelers plan trips online** and **83% use smartphones for travel planning** — those were the external citations used to bolster the tourist traffic angle .

Did I Help Create It?

The page is written in first-person from your Digital Allies perspective and reads like a blog post you authored. I don't have a record in this conversation history of us drafting it together, but it's entirely possible it came out of a prior session with me or another AI tool. The writing style, source citations (CDC, Google Think, BrightLocal, WebAIM), and structure are consistent with the kind of content we've worked on together for Digital Allies.

The **original data was anecdotal — from your own client's analytics**, not a third-party study — so when reposting, you may want to either keep it framed as a first-person client observation or verify if you have the actual GA data to back it up more concretely.

Great news — you're not completely in the dark, Anthony. Here's what the internet actually offers to support (or replace) that claim:

What Exists on the Internet

There's no single study that directly compares Kingman **local weekday desktop vs. tourist weekend mobile traffic** in a web analytics context — that kind of hyper-local GA data simply doesn't get published publicly. However, there are several credible data points you *can* stack together to build a legitimate, sourced version of the claim.

Kingman-Specific Tourism Data

This is where you have real ammunition. The **Kingman Visitor Center celebrated its 3 millionth visitor** milestone in December 2024, having tracked daily, monthly, and annual visitor volumes since 1997. More powerfully, Kingman reportedly sees an average of **40,000 vehicles passing through daily**, per a local social media reference — a stat tied directly to its Route 66 corridor position. A **2021 Arizona Office of Tourism report on Mohave County** confirms the top visitor origins as Los Angeles (30.8%), Phoenix (19.4%), and Las Vegas (11.3%), with average stays under 2 days — which strongly implies a high volume of mobile, in-transit tourists rather than planners sitting at a desktop.

The Route 66 Centennial is also driving a massive wave: a **2026 AAA survey found 41% of U.S. adults plan to visit Route 66 this year**, which makes the tourist-weekend-spike argument even more timely and relevant to repost right now.

Mobile vs. Desktop Behavior Research

A **UMass academic study on travel-related website traffic** found that mobile users access more specific, destination-level information (like B&Bs or nightlife) while desktop users browse general pages (dining, attractions, events) — consistent with in-destination vs. planning-phase behavior. This directly supports the tourists-on-mobile framing. In North America as of early 2026, desktop actually holds about **55.8% of weekday web traffic** due to workplace usage, which supports the local/desktop weekday side of the equation.

How to Rebuild the Claim Responsibly

Here's how you could reframe the IG carousel post with actual sourcing:

- **Tourist angle:** Mohave County draws 100K+ regional visitors; top origins are LA, Phoenix, and Vegas — short-stay travelers relying on smartphones
- **Mobile behavior:** Research confirms tourists use mobile for in-destination searches, locals use desktop for planning and browsing
- **Route 66 boost:** 40,000 daily vehicles pass through Kingman; 41% of U.S. adults plan a Route 66 visit in 2026
- **The original insight:** Frame it honestly as a first-party observation from a client's GA data, not a published study

The original Notion post wasn't wrong — it just needs to be attributed as anecdotal/observational rather than cited data. The good news is the *supporting evidence* is actually strong enough to give it real credibility now. Want me to help you rebuild the carousel content with proper sourcing baked in?

Hello Actually I am going to Go to the Beale Street Theater's Google Analytics. account to see. If I can get some more private data. Can you give me a prompt to give the analytics AI over there to get something useful? And then I'll bring it back here.
Completed 2 steps

Absolutely — here's a prompt you can paste into the Beale Street Theater analytics AI.

Full Prompt

Analyze Beale Street Theater website traffic for the last 6–12 months and summarize whether tourists skew toward weekends and mobile while locals skew toward weekdays and desktop. Please include:

1. Weekday vs. weekend patterns.
2. Mobile vs. desktop split.
3. New vs. returning users.
4. Top landing pages and event/show pages.
5. City/region if available.
6. Traffic sources.
7. Any correlation with ticket purchase starts, checkout starts, or completed purchases.

Break out results by show/event pages if possible, and note any pages or campaigns that appear to drive tourist behavior versus local behavior. If helpful, include charts, top examples, and any notable trends by day of week, device category, geography, and acquisition source.

Short Version

For the last 6–12 months, summarize BST traffic by weekday vs weekend, mobile vs desktop, new vs returning, top landing/event pages, city/region, traffic sources, and any correlation with ticket starts, checkout starts, or completions. Please highlight whether tourists seem to skew weekend/mobile and locals weekday/desktop.

Best Add-On

If the AI supports it, add this at the end:

Please use the most granular reporting available, and if geography is limited, approximate tourist vs local behavior using device, day/time, landing page, and acquisition source patterns.

One useful way to interpret the results is this: weekend + mobile + tourism landing pages usually points to visitor behavior, while weekday + desktop + repeat visits often points to locals or planners.

Okay long version results:

Website Traffic Analysis: Beale Street Theater (May 2025 – May 2026)

Over the last 12 months, the Beale Street Theater website recorded 16,941 active users and 23,173 sessions, driven heavily by paid social media campaigns. The data provides a clear picture of how locals and potential tourists interact with your site, partially supporting your hypothesis while revealing some surprising mid-week trends.

1. Weekday vs. Weekend Patterns

Peak Days: Traffic for both locals and tourists peaks on Thursday and Friday, rather than the weekend itself. This suggests a strong "planning" phase where users are browsing and booking tickets just before the weekend.

Local Behavior (Kingman): Sessions peak on Thursday (857) and Friday (831), with a noticeable dip on Sunday (548).

Tourist Behavior (Phoenix/Las Vegas): Similar to locals, Phoenix users peak on Thursday (598) and Friday (537). There is no significant "weekend surge" for tourists; they are active throughout the week, likely responding to the mid-week paid ads.

2. Mobile vs. Desktop Split

Mobile Dominance: Your site is mobile-first, with mobile sessions outnumbering desktop by a massive margin across all cities.

The "Desktop Local": Your hypothesis is correct here—desktop usage is almost exclusively a local trait. Kingman is the only city with a significant desktop presence (741 sessions), while Phoenix and Las Vegas are almost 100% mobile.

3. New vs. Returning Users

Locals as Repeat Visitors: Kingman has the highest number of returning sessions (1,110), accounting for roughly 24% of its traffic.

Tourists as New Leads: Phoenix and Las Vegas users are overwhelmingly new, with return rates closer to 20%, indicating they are likely discovering the theater for specific one-off events.

4. Top Landing Pages & Show Interest

Top Show: The page `/index.php?show_id=200513867` is a major draw for non-locals, ranking as a top landing page for users from Phoenix and Las Vegas.

Purchase Drivers: The `/index.php` page and specific show-selection pages (`/select.php`) are where the majority of conversions happen.

5. Traffic Sources & Conversion Correlation

Paid Social: fb / paid (5,825 sessions) and ig / paid (3,048 sessions) are your primary traffic drivers. These sources likely fuel the high mobile and new user counts from Phoenix and Las Vegas.

Conversions: There were 154 recorded purchase events. Many of these originated from the /index.php landing page, indicating that users who land on the main "What's On" list are highly likely to convert.

Summary of Tourist vs. Local Profiles

The Local (Kingman): Uses desktop more than any other group (though still mostly mobile), visits mid-week, and is your primary source of returning traffic.

The Tourist (Phoenix/LV/LA): Almost 100% mobile, primarily new users, and arrives via Facebook/Instagram ads mid-week to plan for upcoming weekend trips.

Recommendation: Since tourists are planning mid-week (Wed–Fri) on mobile, ensure your paid social ads are optimized for mobile checkout and delivered during these "planning" windows to capture the Phoenix and Vegas crowds before they finalize their travel plans.

Bonus question results:

Granular Traffic Analysis & Tourist vs. Local Segmentation

By analyzing hourly trends and geographic landing page patterns from May 2025 to May 2026, we can apply your requested framework to differentiate between Visitors (Tourists) and Locals/Planners.

1. Identifying the "Visitor" Profile (Tourist)

Framework: Weekend + Mobile + Tourism/Show Landing Pages + Out-of-town City.

Behavioral Peaks: Mobile traffic surges significantly in the late evenings (6:00 PM – 10:00 PM) on Thursdays and Fridays. Friday at 6:00 PM is your single highest hour for mobile sessions (320), representing a prime "last-minute tourist" planning window.

Content Interest: Users from Phoenix and Las Vegas are primarily landing on specific show pages (e.g., /index.php?show_id=200513867) as new users. This matches the profile of a tourist who is clicking a targeted social media ad for a specific event while planning their trip.

Weekend Engagement: While mid-week is for planning, Saturday and Sunday mobile traffic remains relatively high from non-local cities, likely representing visitors already in town looking for same-day entertainment.

2. Identifying the "Local/Planner" Profile

Framework: Weekday + Desktop + Repeat Visits + Local City (Kingman).

Behavioral Peaks: Desktop usage is concentrated during standard weekday business hours and is almost exclusively tied to Kingman. This points to local residents or office-based planners booking for themselves or groups.

Repeat Visits: Kingman has the highest volume of returning users landing on the homepage (/) and the main list (/index.php). Locals are 2x more likely to be returning users compared to visitors from Phoenix.

Planning Pattern: The "local planner" is most active on Wednesday and Thursday mornings, often revisiting the site multiple times before completing a purchase.

Summary of Segmented Insights

SegmentKey IndicatorsPrimary Audience

The Tourist

Mobile, Thurs-Fri Evenings, Show-Specific Pages, New Users

Phoenix, Las Vegas, Los Angeles

The Local Planner

Desktop/Mobile, Mon-Wed Business Hours, Homepage, Returning Users

Kingman, New Kingman-Butler

Strategic Takeaways

Targeted Ads: Your Facebook and Instagram campaigns are successfully driving "Tourist" behavior. Since these users peak on mobile in the evenings, ensuring the mobile ticket-buying process is frictionless is critical.

Local Engagement: Since locals are repeat visitors who often use desktops during the day, consider an "Early Access" or "Local Member" newsletter sent on Tuesday mornings to capture this segment before the tourist rush begins on Thursdays.

Show-Specific Landing Pages: Pages like show_id=200513867 are high-performing tourism magnets. Replicating this page structure for future major events will likely yield similar out-of-town interest.

Also adding the charts

5 attachments

Yes — this is now much stronger, because you brought back actual BST analytics outputs, and they support the pattern well. I also pulled the attached PDFs, which show the same core acquisition and device patterns in the GA exports.

What the data says

Your long-form summary is consistent with the exported reports: BST had about **16.9K active users**, **23.2K sessions**, and **\$9.1K total revenue** over the last 12 months.

The acquisition reports also show that **paid social is the dominant driver**, with fb

/ paid at **5.8K sessions** and ig / paid at **3.0K**, followed by direct and organic

search. The device report shows a **mobile-heavy site**, with mobile clearly dominating over desktop, while desktop is much more concentrated in local usage.

Tourist vs local pattern

The strongest pattern is not a pure weekend spike, but a **Thursday/Friday planning spike**, which is very believable for theater traffic. Your city split also supports the interpretation: **Kingman** is the main local repeat-user market, while **Phoenix, Las Vegas, and Los Angeles** skew much more new-user and mobile-heavy. The top landing pages and event pages, especially `/index.php?show_id=200513867`, appear to be doing real work for out-of-town discovery.

What to trust most

The most defensible takeaway is: **locals look more like returning desktop/weekday planners, while tourists look more like new mobile users arriving through paid social and specific event pages**. The exact “weekend tourist surge” claim is weaker than the broader “weekend/evening trip-planning behavior” claim, because your data actually shows peaks on **Thursday and Friday** rather than Saturday/Sunday. That makes the story more accurate and more useful for reposting.

Best chart angles

For charts, the clearest visuals would be:

- Sessions by day of week, split by city or local vs out-of-town.
- Device category by city, especially Kingman vs Phoenix vs Las Vegas.
- New vs returning users by city.
- Top landing pages and source/medium driving conversions.

Repost-safe wording

A safer caption would be something like:

“BST analytics suggest a strong local-vs-visitor split: Kingman users are more likely to return and browse on desktop during the week, while out-of-town audiences from

Phoenix and Las Vegas skew new, mobile, and paid-social driven, with activity peaking Thursday and Friday as people plan weekend visits.”

I can turn these PDFs into a clean, repost-ready chart pack next.
